In mathematics, Fourier analysis (*f* ' f or i er, -i er /) is the study of the way general functions may be represented or approximated by sums of simpler trigonometric functions. Fourier analysis grew from the study of Fourier series, and is named after Joseph Fourier, who showed that representing a function as a sum of trigonometric functions greatly simplifies the study of heat transfer.

In mathematics (in particular, functional analysis), convolution is a mathematical operation on two functions (f and g) that produces a third function ($*$) that expresses how the shape of one is modified by the other. The term convolution refers to both the result function and to the process of computing it. It is defined as the integral of the product of the two functions after one is ...
