m -dimensional space.

We still want combinations of the columns (in the column space). We still get m equations to produce b (one for each row).

Those equations may or may not have a solution. They always have a least-squares solution. The interplay of columns and rows is the heart of linear algebra.

**Its Applications
(Fourth Edition)**

- The fourth rule is correct if we define f^{-1} to be the inverse of the function $f(\cdot)$, because then the rule $f(g(x)) = x$ states that $f(f^{-1}(x)) = x$, assuming an inverse of f exists.
- The seventh rule is not true in general since $c(x+y)$ is $cf(g(x))$ and $cx+cy$ is $cf(cg(x))$ which are not the same in general.

Linear Algebra by
Gilbert Strang**

The fourth equation is $x_4 = -5$, and the other equations do not contain the variable x_4 .

The next two steps should be to use the variable x_3 in the third equation to eliminate that variable from the first two equations. In matrix notation, that means to replace R_2 by its sum with 3 times R_3 , and then replace
